

BFD Lite

This Read Me documents known issues and workarounds for the BFD Lite plug-in.

Known Issues

FXpansion BFD Lite Plug-in

Incorrect Version Display during Installation (Issue #105507)

The BFD Lite installer states that the version being installed is 1.5.48.6. The actual version that installs is 1.5.48.5 and is the proper version.

Mac OS X Users Need to Run the BFD Lite Data Setup

In addition to running the BFD Lite Plug-in Mac Setup, Mac OS X users also need to run the BFD Lite Data Setup to install the drum samples. Refer to the Installation Guide in the BFD Lite folder for more information.

BFD Lite Cannot Be Used at the Same Time as BFD (Full Version) (Issue #76836)

BFD Lite is a single-instance version of the full BFD product. It is not designed to be used with the full version. If you have BFD Full installed, remove BFD Lite.

-9128 or 6031 CPU Errors when Toggling User-Created BFD Lite Presets during Playback (Issue #100105)

During playback, BFD Lite may generate CPU errors (-9128 or -6031) when toggling between user-created BFD Lite presets that contain multiple groove assignments. The best workaround is to change presets while the Transport is at rest.

CPU Overload and Buffer Under Run Errors During Playback

You may need to increase the Playback Buffer Size to achieve acceptable playback performance. If -9128 errors occur during playback, try increasing the H/W Buffer Size in the Playback Engine submenu, accessible from the Pro Tools Setup menu.
