

Set Strike Content Location

Dear Digidesign Customer,

If you have manually moved the Strike content files to a different location on your computer, you must run the “Set Strike Content Location” application to tell the plug-in where to find its data. You can find it in the location you selected for the content during installation.

Please follow these instructions to update the content location:

- 1** Put the Set Strike Content Location application next to the content files.
- 2** Double-click the application to run it.
- 3** In the following dialog click “OK” to reset the file directory (hitting “Cancel” will abort without a change).

The next time Strike is used, the content should be recognized correctly.
